# 1 Event Module

---

An event is defined as anything that is part of a calendar. It could be a course that will run on the 14th of May next year, or any other thing that is happening right now, will happen in the future or has happened in the past.

The Event module enables editors to create events on arbitrary pages and have them show up automatically in calendars elsewhere in the site. The CMS system keeps track of all event components.

# 2 Administration

---

## 2.1 Installation

In order for the event system to work, a couple of modules must be added to your site. Make sure that your license allows you to do so before you continue from this point.

### 1. Modules

The Event system consists of the following modules.

- *CMS Event: Main module*
- *CMS Event: Event component*
- *CMS Event: Event Location component*
- *CMS Event: Event Index component*
- *CMS Event: Event tags*

When "CMS Event: Main module" is added, the other modules will be added automatically.

On frontend servers only two modules are needed: "CMS Event: Main module" and "CMS Event: Event tags".

### 2. Database

The "CMS Event: Main module" will by default create an internal database called `event_sitename`. The tables it creates are `event`, `event_category`, `event_date` and `location`. The module can be configured to use a different database.

In a multi server setup a shared database is needed. The "CMS Event: Main module" must be configured to use that shared database on all servers.

### 3. Allowed / disallowed paths

The use of Event components can be restricted to certain parts of the site in the settings for the "CMS Event: Main module". This has the added advantage that all other directories are excluded from being indexed by the event module.

### 4. Templates

To use the factory installed templates for the event module, make sure that `/roxen-files/cms-sites/4.5/event/event.xsl` is imported in your own site templates. Alternatively, you can make local copies of the event templates, customise the copies, and import those instead of the product templates.

## 2.2 Component guide

The following is a short guide to the components in the event suite that can be used in the CMS editor.

### 2.2.1 Event component

Provided by module: *CMS Event: Event component*

An Event component contains data about an actual event. The event's heading will be taken from the page title. Therefore it will not normally make sense to have more than one event per page.

The screenshot shows a web form titled 'Variant' with a 'Standard' dropdown menu. Below it is a 'Visible From' section with a checkbox, 'Set time' and 'Set date' buttons, and the text 'Date format is YYYY-MM-DD.'. The 'Event Dates' section contains a table with columns '#', 'From', 'To', and 'Action'. The first row shows a date range from 2012-09-02 11:00 to 2012-09-02 12:00 with a 'Delete' button. Below the table is an 'Add Event Date' button. The 'Choose Location' section has a dropdown menu set to 'Conference room #1'. At the bottom is a 'Cancel Event' checkbox.

Figure 1. Entering data in the event component

When the page is published it will be indexed by the CMS Event: Main module. The data of the event component and the page's path and title will be stored in the database table.

**Note!**

There may be restrictions on where in the site Event components are allowed, as configured in the Settings tab of the "CMS Event: Main module".

**Visible from**

This works as publish date, meaning that the date and time set here, if enabled, will be the date and time from which the event is visible in event listings and calendars. If the visible from date is later than one of the dates in the event, there will be an error message in the Insite editor (editing view) and the event will not be indexed.

**Event dates**

One or more date ranges can be entered here. For instance: a conference may span several days, but they could be scheduled as one day per week for three weeks. If there is overlap between date ranges, there will be an error message in the Insite editor (editing view) and the event will not be indexed.

**Choose Location**

Set the location where the event takes place. The available locations are taken from location components, which have to be added first (see below).

**Cancel Event**

Tick the checkbox if the data within the event is valid, but the event itself is canceled. The event will still be listed in event listings and calendars.

**Remove an event**

To remove an event, just remove the component that contains the event and publish the page.

**Invalid events**

The following things can cause an event to be invalid.

- Invalid date entries, e.g. '2011-10'
- Incorrect date entries (e.g. 2011-02-29, because 2011 is not a leap year)

- A visible from date that is later than one of the dates in the event
- Overlapping date ranges

Invalid events will not be stored in the database, nor will they show up in the page. The Insite editor (edit view) will give information about the failed validation.

The screenshot shows the CMS Event editor interface. At the top, there's a 'Variant' dropdown set to 'Standard'. Below it, the 'Visible From' section has a checked checkbox, a time field set to '09:00', a date field set to '2012-08-04', and a 'Set date' button. A note indicates 'Date format is YYYY-MM-DD.'. The 'Event Dates' section contains a table with two rows of event dates, each with 'Delete' buttons. The first row shows a time of 12:49 on 2012-08-02 to 13:50 on 2012-08-03. The second row shows a time of 12:49 on 2012-08-03 to 13:49 on 2012-08-03. Below the table is an 'Add Event Date' button. The 'Choose Location' section has a dropdown menu set to 'Conference room #1'. At the bottom, there is a 'Cancel Event' checkbox which is unchecked.

Figure 2. Entering invalid data

This event will **NOT** be considered an event. It will also not be visible for others.  
**Error message:**

1. 'Visible From' time (2012-08-04 09:00:00) is after or overlaps one or more of the event dates.
2. Event dates are incorrect:
  - o **2012-08-02 12:49:00..2012-08-03 13:50:00** is overlapping:
    - 2012-08-03 12:49:00..2012-08-03 13:49:00
  - o **2012-08-03 12:49:00..2012-08-03 13:49:00** is overlapping:
    - 2012-08-02 12:49:00..2012-08-03 13:50:00

This event is not visible right now.	
Publish date	2012-08-04 09:00
Location (place)	Conference room #1 Stockholmstreet 111 118 20 Stockholm Sweden
Event Dates	2012-08-02 12:49 - 2012-08-03 13:50 2012-08-03 12:49 - 2012-08-03 13:49

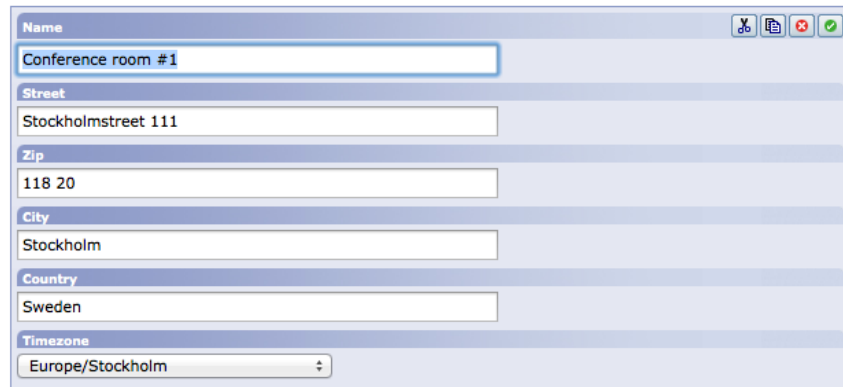

Figure 3. Error messages explaining why the event is not valid

## 2.2.2 Event Location component

Provided by module: *CMS Event: Event Location component*

An Event Location component describes locations where events can take place. The locations entered in an event locations component can be used when an event is created or modified.

---

A screenshot of a web form for entering event location data. The form has a light blue header bar with standard window controls (minimize, maximize, close, refresh) on the right. Below the header, there are several input fields, each with a label above it: 'Name' (containing 'Conference room #1'), 'Street' (containing 'Stockholmstreet 111'), 'Zip' (containing '118 20'), 'City' (containing 'Stockholm'), 'Country' (containing 'Sweden'), and 'Timezone' (a dropdown menu showing 'Europe/Stockholm').

Figure 4. Entering data in the event location component

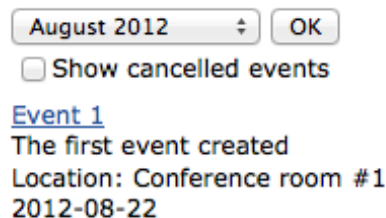

Event Location components can be added to any page within the site, although it will probably make sense to have one central, designated page for this, like for instance /events/locations/. When the page containing the event location component(s) is committed, the location data will be indexed and the locations will become available in the event component.

### 2.2.3 Event Index component

Provided by module: CMS Event: Event Index Component

Events can be presented in lots of different ways, such as in a simple list, or placed in a calendar. The Event Index component provides a set of variants for presentation: "Search", "Month calendar view" and "Month calendar view small".

---

A screenshot of the 'Search' variant of the Event Index Component. It features a date filter dropdown set to 'August 2012' with an 'OK' button next to it. Below the filter is a checkbox labeled 'Show cancelled events' which is currently unchecked. Underneath, there is a link for 'Event 1' followed by the text 'The first event created', 'Location: Conference room #1', and '2012-08-22'.

Figure 5. "Search" variant of the Event Index Component

« Jul | **August** | Sep »

	Mon	Tue	Wed	Thu	Fri	Sat	Sun

27	28	29	30	31	1	2

Figure 7. "Month calendar view small" variant of the Event Index Component

**Note!**

These variants are meant primarily as examples of how to present events. They may need some work to meet the specific requirements in your site.

## 2.2.4 Event categorisation

If categories are available in the site, pages containing an event component can be categorized. In that case, the presentation of events can be filtered according to category. Please note that at present there is no ready made template for this type of presentation.

---

Category:  OK [« Jul](#) | **August** | [Sep »](#)

	Mon	Tue	Wed	Thu	Fri	Sat	Sun
w31	30	31	1	2	3	4	5
